

eB & Maximo® Integration fast facts

Improve operational efficiency and reduce downtime through **Information Integrity.**

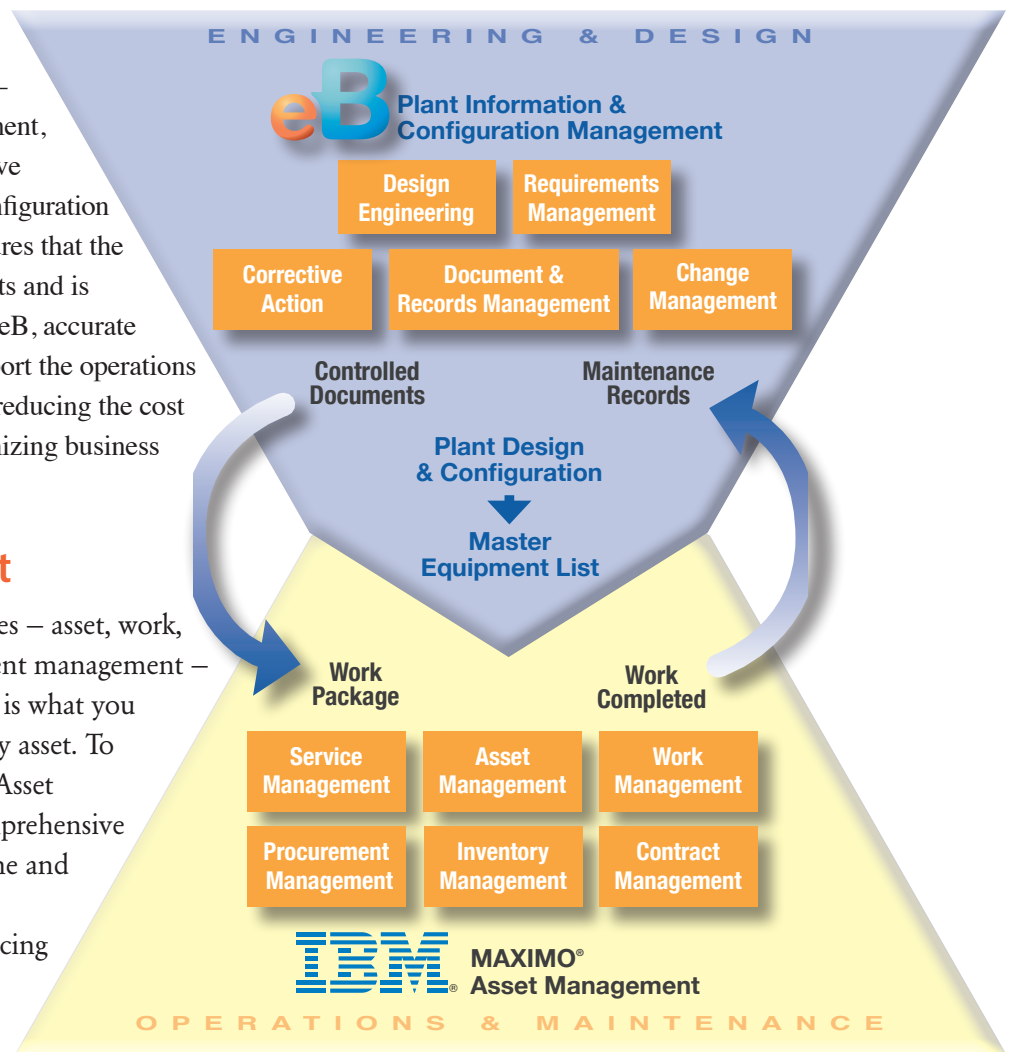

eB enterprise Bridge

Consisting of five integrated applications — design engineering, requirements management, document & records management, corrective action and change management — the eB configuration and information management solution ensures that the plant meets engineering design requirements and is compliant with the operating license. With eB, accurate information is available on demand to support the operations and maintenance processes within a plant, reducing the cost of meeting compliance requirement, minimizing business risk and improving process efficiency.

Maximo Asset Management

Consisting of six key management modules — asset, work, service, contract, materials and procurement management — The Maximo Asset Management solution is what you need to optimize the performance of every asset. To help maximize return on assets, Maximo Asset Management enables you to develop comprehensive programs for preventive, predictive, routine and unplanned maintenance. Together, these programs contribute to your goals of reducing costs and increasing asset uptime.

—IBM Tivoli® Software website

Maximo and eB work seamlessly together to provide a closed-loop process for managing change in a plant. In combination, eB and Maximo bridge the engineering and design environment with the operations and maintenance aspects of a plant. eB maintains the integrity of the master equipment list and related documents and provides Maximo with the necessary and accurate information to perform maintenance/repairs by generating comprehensive Work Packages that are aligned with approved Corrective Actions. Once scheduled work is complete, Maximo provides the detail of the change to eB to close the loop on the corrective action and to record the event to ensure the plant configuration remains consistent with design engineering and, as such, compliant with its operating license.
